## **General Information Sheet**

## **MICROCRYSTALLINE WAX (PHC 3750)**

Microcrystalline Wax is produced during de-oiling of certain fractions of petroleum as part of the refining process. Microcrystalline wax differs from paraffin wax in that the composition contains a high percentage of branched hydrocarbons of fine crystalline (micro) structure making them more flexible and stronger. Characteristically, microcrystalline waxes are generally darker, more viscous, tackier, more elastic and have a higher melt point than paraffin wax.

Available in slab form. Packaging :25 Kilo bags/cartons
